深圳市色彩光电有限公司

Shenzhen LED Color Co.,LTD

1.Product description:

LC8806B is an intelligent externally controlled LED that integrates a control circuit and a light-emitting circuit. Its appearance is the same as a 5050 LED . Each LED is a pixel. The LED contains an intelligent digital interface data latch signal circuit, Power supply voltage regulator circuit, built-in constant current circuit, data regeneration circuit, high precision RC oscillator, output drive adopts patented PWM technology, which effectively guarantees the color consistency of the each pixel.

The data protocol adopts a unipolar return-to-zero code communication method. After the LED is powered on, the DIN terminal receives external signal data, and the data regeneration circuit automatically reshapes and forwards the cascaded output data to ensure that the data is transmitted in series without attenuation and normal transmission .

LC8806B has the advantages of low voltage drive, environmental protection and energy saving, high brightness, large scattering angle, good consistency, long life and so on. The control circuit is integrated inside the LED, which makes the application circuit design easier, less original parts, and small in size. Beautiful, easier to install.

2.Main application areas:

LED full-color luminous character string light, LED full-color soft and hard light bar, LED point light source, LED pixel screen, LED special-shaped screen, LED full-color module, car lights, shoe lights, toys, audio, home appliances, and various electronics product.

3.Feature:

- Smart SMD integrates high-quality external control single-wire serial cascaded constant current IC.
- The control circuit and chip are integrated in SMD components to form a complete externally controlled pixel point, color,color temperature, uniform effect and high consistency,and the default output constant current value OUTR/OUTG/OUTB is 17MA
- Built-in data shaping circuit, any pixel point receives the signal after waveform shaping and then output to ensure that the signal waveform distortion will not accumulate. Data shaping: After receiving the data of this unit, the subsequent data will be shaped and output automatically.
- Built-in power-on reset and power-down reset circuits, the light does not light up after power-on.
- Single-wire data transmission, unlimited cascading, data sending rate 800Kbps synchronous refresh
- Grayscale adjustment circuit (256-level grayscale is adjustable).
- Vertical SMD surface mount package, suitable for all SMT assembly and soldering processes.
- Moisture-proof grade: LEVEL5a.
- CE, RoHS certification.

Shenzhen LED Color Co.,LTD

4.Package size drawing:

Remarks: All dimensions are marked in millimeters and the tolerance is ± 0.15 mm, unless otherwise specified.

5.Pin diagram and function description:

No.	Symbol	Function description
1	DOUT	Control data signal output
2	DIN	Control data signal input
3	NC	Empty feet
4	VDD	Power supply
5	G	Green output
6	R	Red output
7	B	Blue output
8	GND	Ground

6.RGB chip characteristic parameter Ta=25°C :

Color	Wavelength (nm)	Light intensity (mcd)	Lumen (LM)
Red	620-630	400-800	1.5-3.0
Green	520-535	1000-1800	4.5-56.0
Blue	460-475	300-500	0.8-1.5

深圳市色彩光电有限公司

Shenzhen LED Color Co.,LTD

7. Electrical parameters (limit parameters, unless otherwise specified, Ta=25°C):

Parameter	Symbol	Range	Unit
Voltage	V _{DD}	+3.0~+26	V
Logic input voltage	V _I	-0.3-0.6	V
Working temperature	T _{opt}	-40~+85	°C
Storage temperature	T _{stg}	-50~+85	°C
ESD pressure (Device mode)	V _{ESD}	200	V
ESD pressure (body model)	V _{ESD}	4000	V

8. Electrical characteristics (if no special instructions, VDD=5V, Ta=25°C):

Parameter	Symbol	Min	Typical	Max	Unit
The chip supply Voltage	V _{DD}	-	5.0	26	V
R/G/B port pressure	V _{DS}	-	28	-	V
High level input voltage	V _{IH}	0.7	-	-	V
Low level input voltage	V _{IL}	-	-	0.3	V
Quiescent Current	I _{DD}	-	1	1	mA
PWM Frequency	f _{PWM}	-	1.2	-	KHZ

9. Switching characteristics (if no special instructions, VDD=5.0V, Ta=25°C):

Parameter	Symbol	Min	Typical	Max	Unit	Test conditions
The speed of data transmission	f _{DIN}	-	800	-	KHz	-
DOUT transmission delay	t _{PLZ}	-	-	500	ns	-

深圳市色彩光电有限公司

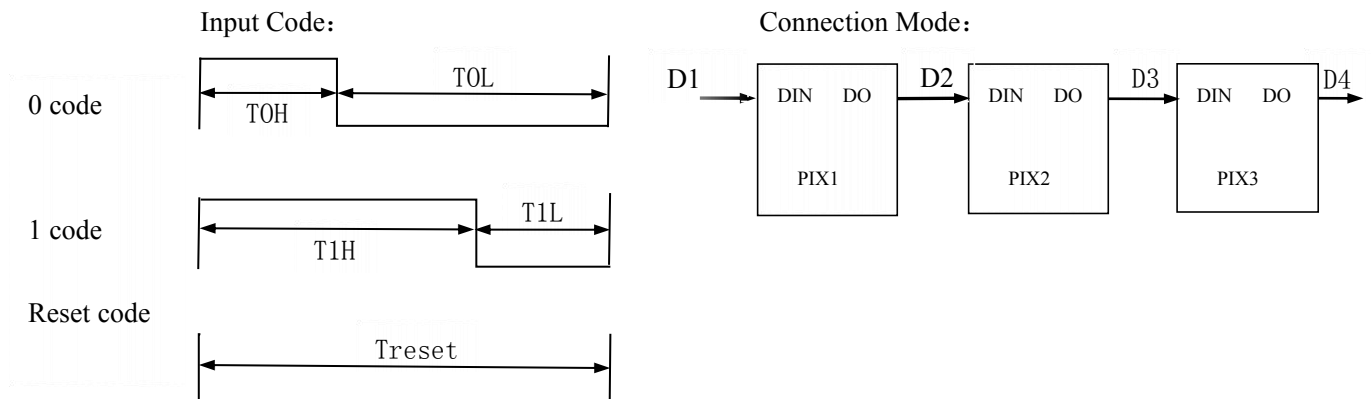

Shenzhen LED Color Co.,LTD

10.Data transmission time($T_H+T_L=1.25\mu s\pm 600ns$):

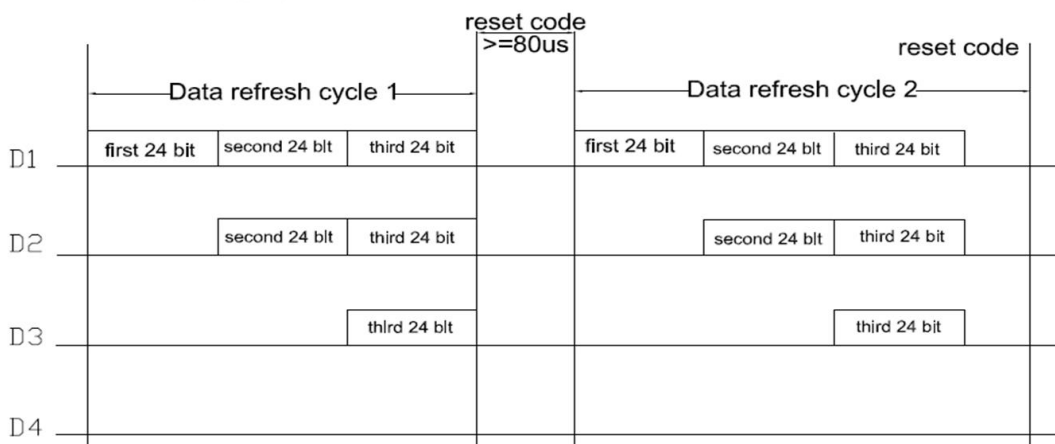

Name	Description	Min	Typical	Max	Allowable error	Unit
T0H	0 code, high level time	-	0.3	-	± 0.05	US
T1H	1 code, high level time	-	0.9	-	± 0.05	US
T0L	0 code, low level time	-	0.9	-	± 0.05	US
T1L	1 code, low level time	-	0.3	-	± 0.05	US
TRST	Reset code, low level time	-	80	-	-	US

11.Coding timing diagram:

The chip protocol uses a unipolar return-to-zero code, and each symbol must have a low level. Each symbol of this protocol starts with a high level, and the time width of the high level determines the "0" code or the "1" code.

12.Data transmission method ($T_a=25^\circ C$) :

深圳市色彩光电有限公司

Shenzhen LED Color Co.,LTD

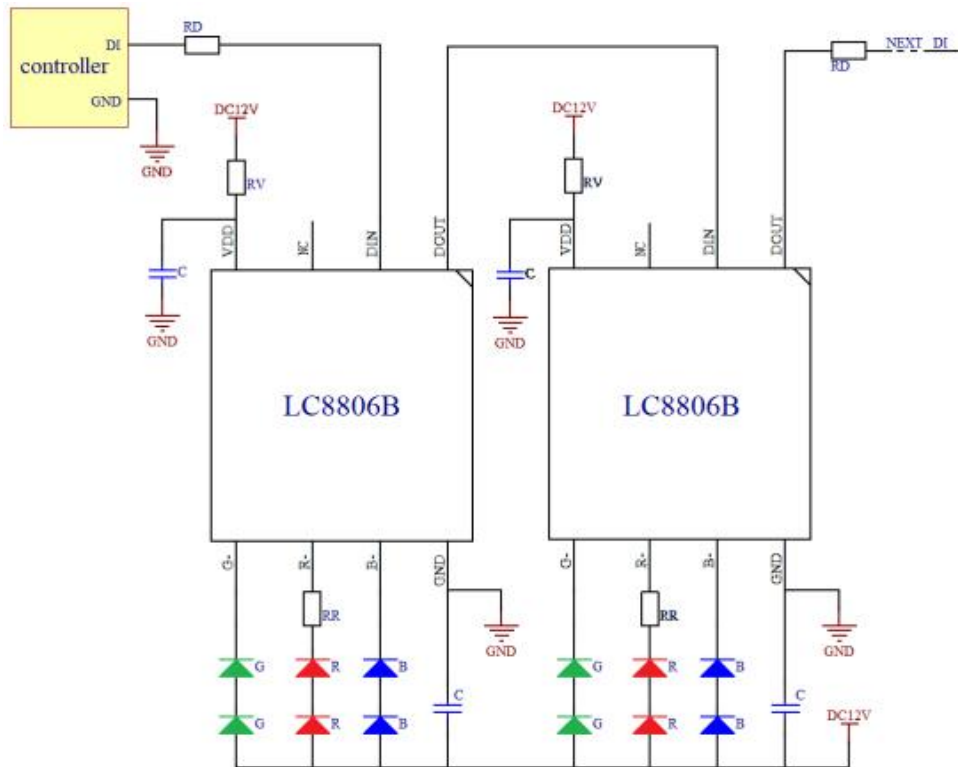

Note: D1 is the data sent by the MCU, and D2, D3, and D4 are the data that the cascade circuit automatically reshapes and forwards.

13.Data structure (Ta=25°C):

G7	G6	G5	G4	G3	G2	G1	G0	R7	R6	R5	R4
R3	R2	R1	R0	B7	B6	B5	B4	B3	B2	B1	B0

Note: The high bit is sent first, and the data is sent in the order of GRB (G7 → G6 →.....B0).

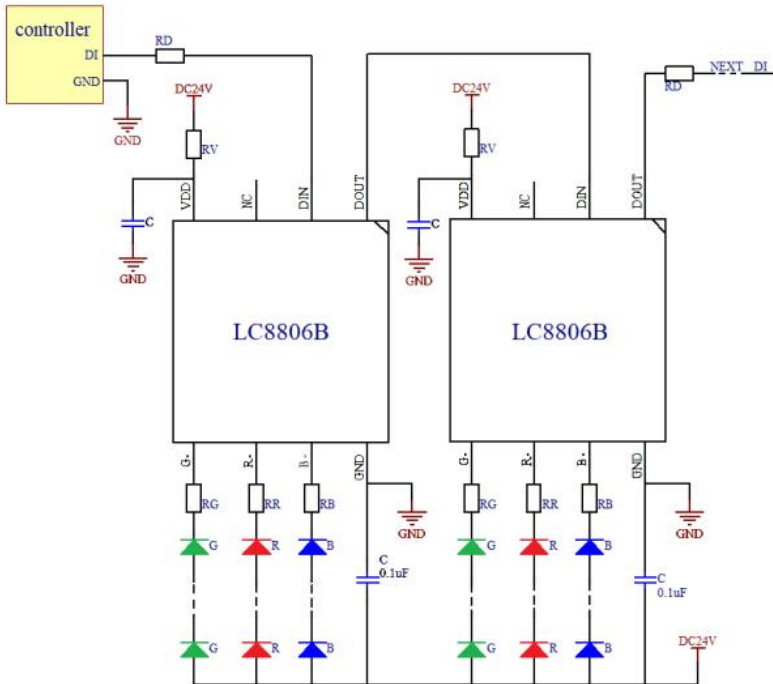

14.Typical application circuit:

For 12V applications, the DIN, input and output terminals of the product need to be connected in series with the protective resistance R. The size depends on the number of cascaded led chip. The more cascades, the smaller R. Generally, it is recommended to take between 51-75 ohms, the distance between two points can reach 10 meters.

深圳市色彩光电有限公司

Shenzhen LED Color Co.,LTD

For 24V application, the product's DIN output terminal needs to be connected in series with the protective resistance R. The size depends on the number of cascaded led chip. The more cascades, the smaller R. Generally, it is recommended to be 120 ohms, and the distance between two points can reach 5 -10 m.

The input and output terminals of the product DIN need to be connected in series when necessary. The size of the protective resistor R depends on the number of cascaded led. The more the number of cascades, the smaller the R. Generally, a value between 100-120 ohms is recommended. Two point distance transmission up to 10 meters.

Typical application circuit parameters include the power supply input voltage V_{IH} , current limiting resistor R_{IN} , chip VDD, capacitor C_{IN} and R/G/B LED limiting resistor Current resistance R_L .

Chip supply voltage VDD: $V_{DD} = V_{IN} - (I_{DD} + I_{IN}) * R_{IN}$, I_{IN} is the working current of the voltage regulator circuit inside the chip, I_{DD} is the static current of the chip (except the current of the voltage regulator circuit), and the resistance value of R_{IN} must ensure $V_{DD} > 4V$.

The higher the R_{IN} resistance, the lower the system power consumption, but the system anti-interference ability is weak; The smaller the R_{IN} resistance is, the greater the power consumption and the higher the operating temperature are. Therefore, the resistance R_{IN} should be selected according to the application environment of the system during design. The relationship between V_{IN} and R_{IN} is shown in the table below:

V_{IN}	5V	6V	9V	12V	15V	18V	24V
R_{IN}	33	100	470	1K	1.5K	2K	3K

LED current limiting resistors R_L :
$$R_L = \frac{V_{IN} - N * V_{LED} - V_{DS}}{I_{LED}}$$

V_{IN} is the input voltage, V_{LED} is the voltage drop of LED, V_{DS} is the port voltage, When it reaches 1V, the current can be output constant, and the I_{LED} is the port output current.

Shenzhen LED Color Co.,LTD

SMD LED Usage Notice

Thank you for using the LED chip of Shenzhen LED Color Co., Ltd.. In order to enhance your understanding of the characteristics of our products, and to facilitate you to quickly grasp the basic operations of the products, in order to minimize or avoid unnecessary products caused by human factors damaged, so that it can better serve your production, specially for some standard use in the process of use for corresponding instructions. At the same time even if the same specification LED, its reliability and design level in the actual application field, operation mode, use conditions They are all related. This instruction manual cannot cover all the problems that customers may encounter during use. We apologize for the inconvenience caused!

1.1 Generally, LEDs are used in the same way as other electronic components. In order to allow customers to better use our LED products, please refer to the following LED protection precautions.

1.2 Transportation and storage

Smart LED is packaged in a moisture-proof and anti-static aluminum foil bag. Avoid squeezing or piercing the packaging bag during transportation, and take necessary anti-static protection measures. Before the product is produced, if air leakage or damage is found, please stop using it directly and do the necessary use after high temperature dehumidification. In the process of product replacement, placement, finished product shipment, and installation, care should be taken to prevent external force from colliding and squeezing the LED, causing external force to damage the LED.

If the aluminum foil bag has been discovered before production, unsealed, damaged, or leaked, please return it to the original factory for dehumidification testing in time, and never use it online. Smart LED is a humidity-sensitive element. Packaging the LED in an aluminum foil bag is to prevent the LED from absorbing moisture during transportation and storage. A desiccant is placed in the packaging bag to absorb moisture. If the LED absorbs moisture, the moisture will expand when the LED is reflowed, causing the gel to separate from the bracket, or damage the key alloy wire, causing the product to fail. For this reason, the vacuum moisture-proof packaging is to avoid moisture in the packaging bag. The moisture-proof grade of this product is LEVEL5a.

Diagram 1: Definition of Material Moisture Resistance Level (MSL) specified by IPC/JEDEC J-STD-020

Moisture Resistance level	Workshop life after unpacking	
	Time	Condition
LEVEL1	Unlimited	$\cong 30^{\circ}\text{C}/85\% \text{ RH}$
LEVEL2	1year	$\cong 30^{\circ}\text{C}/60\% \text{ RH}$
LEVEL2a	4weeks	$\cong 30^{\circ}\text{C}/60\% \text{ RH}$
LEVEL3	168hours	$\cong 30^{\circ}\text{C}/60\% \text{ RH}$
LEVEL4	72hours	$\cong 30^{\circ}\text{C}/60\% \text{ RH}$
LEVEL5	48hours	$\cong 30^{\circ}\text{C}/60\% \text{ RH}$
LEVEL5a	24hours	$\cong 30^{\circ}\text{C}/60\% \text{ RH}$
LEVEL6	Take out and use	$\cong 30^{\circ}\text{C}/60\% \text{ RH}$

1.3.Storage before opening

In order to avoid redundancy failure caused by moisture absorption, it is necessary to take good measures to store and prevent moisture before LED products are produced.

If the vacuum moisture-proof bag is not opened, the storage time of Smart SMD components is within 1 month under

深圳市色彩光电有限公司

Shenzhen LED Color Co.,LTD

30°C/ 60%RH. (Subject to the date of the label, use the vacuum package without air leakage. There are certain differences in the storage time of different moisture-proof materials or packaging. The specific storage time is subject to the specification or the packaging bag.) It is recommended before use Do not open the vacuum packaging bag.

1.4. SMT production control

After opening the packaging bag, the materials shall be strictly controlled within the allowable range of maximum humidity and operating time specified in diagram 1. As long as the material is exposed to the environment described in diagram 1, it must be used in the workshop. After opening the packaging bag and affixed to the PCB, the welding work should be completed within 2H. It is not recommended to stick the material on the PCB, and to stay in the workshop for a long time without SMT furnace operation, so as to prevent the material from absorbing the moisture in the solder paste and causing bad risks.

1.5. Moisture-proof storage of unused materials

If a roll of led material has not been used up at one time, and the temperature and humidity of the workshop are within the limited conditions ($\leq 30^{\circ}\text{C}/60\%\text{RH}$), and the exposure time of the element in the air does not exceed 2H, the remaining materials should be put into desiccant together. Vacuum and seal storage. Otherwise, the material must be baked and dehumidified at low humidity, and the dehumidified material can be repackaged to restart the calculation of time.

1.6. Moisture-proof control for the assembled LED components

For products that require a secondary SMT process or high temperature, the necessary moisture-proof treatment should also be done before the secondary welding after the completion of the first welding. Exposure to ($\leq 30^{\circ}\text{C}/60\%\text{RH}$) conditions, the longest No more than 2H. If the time between the second high temperature production is longer, the material after the first welding must be dehumidified (bake in an oven at $70^{\circ}\text{C}\pm 5^{\circ}\text{C}$ for no less than 12 hours), and then vacuum sealed , or store the product in a constant temperature and humidity oven in a drying oven. Before the second high temperature production, do dehumidification work (bake in an oven at $70^{\circ}\text{C}\pm 5^{\circ}\text{C}$ for no less than 12 hours) to ensure that the product is not damp before the high temperature process. Low-humidity baking conditions: $70^{\circ}\text{C}\pm 5^{\circ}\text{C}$ for no less than 12 hours; high-temperature baking conditions: $130^{\circ}\text{C}\pm 5^{\circ}\text{C}$ for 5 hours, and the total number of normal reflow soldering operations does not exceed 3 times.

For products subjected to extrusion process or high-temperature protection treatment, it is recommended that the necessary dehumidification work be done before the product is protected. Bake in an oven at $130^{\circ}\text{C} \pm 5^{\circ}\text{C}$ for 5 hours to eliminate the moisture absorbed by the product during testing, aging, and transportation. In order to avoid the product after the protective treatment, the moisture wrapped on the surface of the material will slowly enter the material and cause the product to fail.

1.7. Reflow soldering

It is verified by us using the parameters listed below that the surface mount LED meets the JEDEC J-STD-020C standard. As a general guideline, we recommends that customers follow the soldering temperature curve recommended by the manufacturer of the solder paste used.

Please note that this general guideline may not apply to all PCB designs and reflow soldering equipment configurations

深圳市色彩光电有限公司

Shenzhen LED Color Co.,LTD

Profile Feature	Lead-Based Solder	Lead-Free Solder
Average Ramp-Up Rate (Ts max to Tp)	3 °C/second max	3 °C/second max
Preheat: Temperature Min (Ts min)	100°C	150°C
Preheat: Temperature Min (Ts max)	150°C	200°C
Preheat: Time (ts min to ts max)	60-120 seconds	60-180 seconds
Time Maintained Above: Temperature (TL)	183 °C	217 °C
Time Maintained Above: Time (tL)	60-150 seconds	60-150 seconds
Peak/Classification Temperature (TP)	215 °C	240 °C
Time Within 5°C of Actual Peak Temperature (tp)	<10 seconds	<10 seconds
Ramp-Down Rate	6 °C/second max	6 °C/second max
Time 25 °C to Peak Temperature	<6 minutes max	<6 minutes max

Note: All the temperature refer to topside of the package, measured on the package body surface. When welding, do not forcefully press the surface of the colloid when the material is heated.

1.8.SMT nozzle requirements:

(red circle refers to the inside diameter of the nozzle, see picture 1 and picture 2)

OK (the inside diameter of the nozzle is larger than the light-emitting area of the led)

NG (the inside diameter of the nozzle is smaller than the lighting area of the led)

深圳市色彩光电有限公司

Shenzhen LED Color Co.,LTD

In order to prevent air pressure leakage, the outer diameter of the SMD nozzle should not exceed the size of the LED, and the inner diameter of the nozzle should be as large as possible. The tip of the nozzle should be made of soft material to prevent scratching or damaging the LED gel surface during suction. The size of the component must be Accurate in the pick and place machine.

1.9. Material picking method: use tweezers to pick up the material. Do not press the colloid or sharp objects to puncture the colloid. The materials cannot be stacked.

Do not stack products together, it may damage the internal circuit,

Cannot be used in acidic places with $\text{PH} < 7$

2.0. When we need to use the external sealant to coat the LED products, we should ensure that the external sealant matches the LED packaging glue, because most of the LED packaging glue is silica gel and epoxy glue, it has oriented oxidation and aligned moisture absorption. It is necessary to prevent the external sealing material from entering the LED to cause damage to the LED. The content of a single bromine element is required to be less than 900PPM, and the content of a single chlorine element is required to be less than 900PPM. When applying LED products, the total content of bromine and chlorine in the outer sealant must be less than 1500PPM.

2.1. Welding

For manual soldering, it is recommended to use an electric soldering iron with a power of not more than 60W, and control the temperature of the soldering iron not to exceed 350°C . The electric soldering iron stays on the bracket pin for no

深圳市色彩光电有限公司

Shenzhen LED Color Co.,LTD

more than 3 seconds each time. If you need to repeatedly solder, the interval stay time is not less than 3 seconds to avoid long time high temperature damage to the LED.

During the soldering process, please do not touch or squeeze the surface of the LED to avoid damage to the LED interior. At the same time, please pay attention to avoid scalding and other damages to the LED surface colloid and PPA by the soldering iron.

2.2. Thermal design requirements

For LED products, the design of heat dissipation is very important. When designing the product, please consider the heat generated by the LED, the thermal resistance of the PCB board, the density of the LED arrangement, and the input electric power will all increase the temperature.

In order to avoid excessive heat generation, it is necessary to ensure that the LED runs within the maximum specification range required in the product specification. When setting the driving power of the LED, the highest ambient temperature should be considered.

The maximum working temperature of the product cannot exceed 50°C (ie $\leq 50^{\circ}\text{C}$, which refers to the operating temperature at the GND of the LED pin).

2.3. Anti-static and surge protection for IC devices

Static electricity and surges can damage the LED products of IC devices. Therefore, corresponding protective measures must be taken. The signal input and output ports of the IC device are connected with protective resistors in series to prevent the product from failing due to surge or electrostatic shock.

In order to protect the LED products of IC devices, no matter what time or occasion, as long as you touch the LED, you need to wear an anti-static wristband and anti-static gloves. All equipment and instruments must be grounded.

It is recommended that each product is inspected before shipment, and there should be related electrical tests to select defective products caused by static electricity. When designing the circuit, consider eliminating the possibility of surges from harming LEDs.

2.4. Special statement

1. If it is used outside of the specification, our company will not be responsible for any problems.
2. The LED can emit a strong light that can damage the eyes. Take precautions and do not look directly at the LED light with the naked eye for too long.
3. Before mass use, you should communicate with relevant personnel of our company to understand more detailed specifications.
4. If the shape and specifications of LED products are changed, please forgive me for not being able to inform in time.
